GLP-1 (active) ELISA

Enzyme immunoassay for the quantitative determination of active Glucagon-Like Peptide-1 (GLP-1(7-36) and GLP-1(7-37)) in EDTA plasma

REF JP27784

12 x 8

For illustrative purposes only. To perform the assay the instructions for use provided with the kit have to be used.

GLP-1, Active form Assay Kit - IBL

INTRODUCTION

Incretins are a group of gastrointestinal hormones that cause an increase in the amount of insulin released from the beta cells of the islets of Langerhans after eating. They also inhibit glucagon release from the alpha cells of the islets of Langerhans. As a result, they slow the rate of absorption of nutrients into the blood stream by reducing gastric emptying and may directly reduce food intake. The two main candidate molecules that fulfill criteria for an incretin are glucagon-like peptide-1 (GLP-1) and Gastric inhibitory peptide (or glucose-dependent insulinotropic polypeptide or GIP). The human proglucagon gene was cloned in 1983, and the human proglucagon sequence was subsequently deduced. After that, it was found that the specific sequence of GLP-1 has insulinotropic effect: GLP-1 (7-36) amide and GLP-1 (7-37) are known as active forms of GLP-1. They are rapidly inactivated to GLP-1 (6-36) amide and GLP-1 (9-37) by DPP-IV within a few moments in blood. This ELISA kit can measure active forms of GLP-1 (7-36) amide and GLP-1 (7-37) specifically.

PRINCIPLE

This kit is a solid phase sandwich ELISA using 2 kinds of highly specific antibodies. Tetra Methyl Benzidine (TMB) is used as a coloring agent (Chromogen). The strength of coloring is proportional to the quantities of active form of GLP-1.

MEASUREMENT RANGE

1.25 - 80 pmol/L
(4.1 - 263.8 pg/mL of GLP-1 (7-36) amide (as molecular weight is 3297.6))

INTENDED USE

For research use only, not for use in diagnostic procedures.

This IBL's assay kit is capable for the quantitative determination active form of GLP-1 (GLP-1 (7-36) amide and GLP-1 (7-37)) in EDTA-plasma. DPP-IV inhibitor has to be added when collecting samples, or use purpose-made blood collection tubes in order to preserve GLP-1.

KIT COMPONENT

1. Precocated plate - Anti-GLP-1 Rabbit IgG Affinity Purify 96Well x 1
2. Labeled antibody Conc. : (30X) HRP conjugated Anti-GLP-1 (H41) Mouse IgG MoAb Fab' Affinity Purify 0.4ml, x 1
3. Standard : GLP-1 (7-36) amide 0.5ml, x 2
4. ELA buffer : 1% BSA, 0.05% Tween20 in PBS 30ml, x 1
5. Solution for Labeled antibody : 1% BSA, 0.05% Tween20 in PBS 12ml, x 1
6. Chromogen : TMB solution 15ml, x 1
7. Stop solution : 1N H2SO4 12ml, x 1
8. Wash buffer : (40X) 0.05% Tween20 in phosphate buffer 50ml, x 1

OPERATION MANUAL

1. Materials needed but not supplied

- Plate reader (450nm)
- Micropipette and tip
- Graduated cylinder and beaker
- Insuffcient washing may lead to the failure in measurement.

2. Preparation

1) Preparation of wash buffer

"8. Wash buffer Conc." is a concentrated (40X) buffer. Adjust the temperature of "8. Washing buffer Conc." to room temperature and then, mix it gently and completely before use. Dilute 50 mL of "8. Wash buffer Conc." with 1,950 mL of deionized water and mix it. This is the wash buffer for use. This prepared wash buffer shall be stored in refrigerator and used within 2 weeks after dilution.

2) Preparation of Labeled antibody

"2. Labeled antibody Conc." is a concentrated (30X) Dilute "2. Labeled antibody Conc." with 9. Solution for Labeled antibody in 30 times according to required quantity into a disposable test tube. Use this resulting solution as Labeled antibody. Example: In case you use one strip (8 well), the required quantity of Labeled antibody is 800 μL. Dilute 30 μL of "2. Labeled antibody Conc." with 870 μL of "9. Solution for Labeled antibody" and mix it. And use the resulting solution by 100 μL in each well. The operation should be done just before the applying of Labeled antibody.

3) Preparation of Standard

Put just 0.5 mL of deionized water into the vial of "3. Standard" and mix it gently and completely. This solution is 160 pmol/L GLP-1 (7-36) amide standard.

4) Dilution of Standard

Specify the following concentration of each tube.

- Tube-1 : 80 pmol/L
- Tube-2 : 40 pmol/L
- Tube-3 : 20 pmol/L
- Tube-4 : 10 pmol/L
- Tube-5 : 5 pmol/L
- Tube-6 : 2.5 pmol/L
- Tube-7 : 1.25 pmol/L
- Tube-8 : 0 pmol/L (Test Sample Blank)

Put 230 μL of Standard solution into tube-1 and mix it gently. Then, put 230 μL of tube-1 mixture into tube-2. Dilute two times standard solution in series to set up 7 points of diluted standard between 80 pmol/L and 1.25 pmol/L. Tube-8 is the test sample blank as 0 pmol/L.

See following picture.

5) Dilution of test sample

Test samples should be diluted with "4, EIA buffer" as necessary. If the concentration of active form GLP-1 in samples may not be estimated in advance, the pre-assay with several different dilutions will be recommended to determine the proper dilution of samples.

3. Measurement procedure

All reagents shall be brought to room temperature approximately 30 minutes before use. Then mix it gently and completely before use. Make sure of no change in quality of the reagents. Standard curve shall be prepared simultaneously with the measurement of test samples.

---

For research use only, not for use in diagnostic procedures.

---

1) Determine wells for reagent blank. Put 100 μL each of "4, EIA buffer" into the wells.

2) Determine wells for test sample blank, test sample and diluted standard. Then, put 100 μL each of test sample blank (tube-8), test sample and dilutions of standard (tube-1-7) into the appropriate wells.

3) Incubate the precoated plate for 60 minutes at 37°C after covering it with plate lid.

4) Wash each well of the precoated plate with wash buffer using a washing bottle or a plate washer. Fill each well with wash buffer and shake off the wash buffer completely from the precoated plate. This procedure must be repeated 4 times. Then, drain the precoated plate completely on paper towel.

5) Pipette 100 μL of labeled antibody solution into the wells of test samples, diluted standard and test sample blank.

6) Incubate the precoated plate for 60 minutes at 4°C after covering it with plate lid.

7) Wash the precoated plate 5 times in the same manner as 4).

8) Take the required quantity of "6, Chromogen" into a disposable test tube. Then, pipette 100 μL from the test tube into every well. Please do not return the rest in the test tube to "6, Chromogen" bottle to avoid contamination.

9) Incubate the precoated plate for 30 minutes at room temperature in the dark. The solution of Chromogen will turn blue.

10) Add 100 μL of "7, Stop solution" to all wells. Mix the solution by tapping the side of precoated plate. The solution will turn yellow by addition of "7, Stop solution".

11) Remove any dirt or drop of water on the bottom of the precoated plate and confirm there is no bubble on the surface of the solution. Then, run the plate reader and conduct measurement at 450 nm against a Reagent blank.

The measurement shall be done within 30 minutes after addition of "7, Stop solution".

SPECIAL ATTENTION

1) Test samples should be measured soon after collection. For the storage of test samples, store them frozen and do not repeat freeze-thaw cycles. Thaw the test samples at a low temperature and mix them completely before measurement.

2) Test samples should be diluted with "4, EIA buffer", as the need arises.

3) Duplicate measure of test samples and standard is recommended.

4) Use test samples in neutral pH range. The contaminations of organic solvent may affect the measurement.

5) Use only wash buffer contained in this kit for washing the precoated plate. Use sufficient washing may lead to the failure in measurement.

6) Remove the wash buffer completely by tapping the precoated plate on paper towel. Do not wipe wells with paper towel.

7) "6, Chromogen" should be stored in the dark due to its sensitivity against light.
CALCULATION OF TEST RESULT

Subtract the absorbance of test sample blank from all data, including standards and unknown samples before plotting. Plot the subtracted absorbance of the standards against the standard concentration on log-log graph paper. Draw the best smooth curve through these points to construct the standard curve. Read the concentration for unknown samples from the standard curve.

6. Sensitivity

   0.10 pmol/L

   The sensitivity for this kit was determined using the guidelines under the National Committee for Clinical Laboratory Standards (NCCLS) Evaluation Protocols. (National Committee for Clinical Laboratory Standards Evaluation Protocols. SC1, (1989) Villanova, PA: NCCLS.)

PRECAUTION FOR INTENDED USE AND/OR HANDLING

1. All reagents should be stored at 2 - 8°C. All reagents shall be brought to room temperature approximately 30 minutes before use.

2. "3. Standard" is lyophilized products. Be careful to open this vial.

3. "7. Stop solution" is a strong acid substance. Therefore, be careful not to have your skin and clothes contact "7. Stop solution" and pay attention to the disposal of "7. Stop solution".

4. Dispose used materials after rinsing them with large quantity of water.

5. Precipitation may occur in "2. Labeled antibody Conc.", however, there is no problem in the performance.

6. Wash hands after handling reagents.

7. Do not mix the reagents with the reagents from a different lot or kit.

8. Do not use expired reagents.

9. This kit is for research purpose only. Do not use for clinical diagnosis.

STORAGE AND THE TERM OF VALIDITY

**Storage Condition**

-2 - 8°C

The expiry date is specified on outer box.

Version 1.4

Made in Japan.
LIABILITY: Complaints will be accepted in each mode –written or vocal. Preferred is that the complaint is accompanied with the test performance and results. Any modification of the test procedure or exchange or mixing of components of different lots could negatively affect the results. These cases invalidate any claim for replacement. Regardless, in the event of any claim, the manufacturer’s liability is not to exceed the value of the test kit. Any damage caused to the kit during transportation is not subject to the liability of the manufacturer.
