sCD134 (OX40) ELISA

Enzyme immunoassay for the quantitative determination of human sCD134 (OX40) in cell culture supernatants, serum, plasma or other body fluids

REF BE59401

1. INTENDED USE

The sCD134 ELISA is an enzyme-linked immunosorbent assay for quantitative detection of human sCD134 in cell culture supernatants, human serum, plasma or other body fluids. The sCD134 ELISA is for research use only. Not for use in diagnostic or therapeutic procedures.

2. SUMMARY

OX40 (CD134) is a member of the tumor necrosis (TNF) receptor superfamily and known to be an important costimulatory molecule expressed on activated T-cells (5, 25). Interaction of OX40 with its ligand, OX40L, is thought to be important in T cell activation through T cell/antigen-presenting cell (APC) interaction (30). Ligation of OX40 induces clonal expansion and survival of CD4 cells during primary responses, and results in the accumulation of greater numbers of memory cells with time (9).

Further OX40 has been shown to be involved in the T cell adhesion to endothelium (1, 12). Induction of CD134 by Interleukin-4 has been suggested, which thus acts in a TH-2 type cytokine environment (10, 13, 20). OX40 expression is found besides T cells in a small subpopulation of macrophages, in Langerhans cells (22), and in B-cells in non Hodgkin’s lymphoma (6). OX40 promotes Bcl-xL and Bcl-2 expression thus being a critical regulator of antigen-driven T cell survival (19). OX40 signaling renders adult T cell leukemia cells resistant to Fas-induced apoptosis (16).

It has been described as a molecule involved in regulating immunological tolerance, which represents a major obstacle in developing effective immunotherapy against tumors (2, 3, 26).
A soluble isoform of OX40 has been described (28). Measurement of this molecule may have diagnostic value in polymyositis and granulomatous myopathy (27), in T cell lymphoma (14) and lymphomatoid papulosis (8), in proliferative lupus nephritis (1), in rheumatoid arthritis (7, 30), in HIV infection (24), in viral infections of the lung (11, 21), in the regulation of graft-versus-host disease (4, 15), in myocarditis and dilated cardiomyopathy (23). The crucial role of OX40 in development of autoimmune diseases has further been shown (17, 18, 29).
3. PRINCIPLES OF THE TEST

An anti-sCD134 monoclonal coating antibody is adsorbed onto microwells.

sCD134 present in the sample or standard binds to antibodies adsorbed to the microwells; a biotin-conjugated monoclonal anti-sCD134 antibody is added and binds to sCD134 captured by the first antibody.

Following incubation unbound biotin conjugated anti-sCD134 is removed during a wash step. Streptavidin-HRP is added and binds to the biotin conjugated anti-sCD134. Following incubation unbound Streptavidin-HRP is removed during a wash step, and substrate solution reactive with HRP is added to the wells.

A coloured product is formed in proportion to the amount of sCD134 present in the sample. The reaction is terminated by addition of acid and absorbance is measured at 450nm. A standard curve is prepared from seven sCD134 standard dilutions and sCD134 sample concentration determined.
4. REAGENTS PROVIDED

1 aluminium pouch with a Microwell Plate coated with Monoclonal Antibody (murine) to human sCD134

1 vial (100 µl) Biotin-Conjugate anti-sCD134 monoclonal antibody

1 vial (150 µl) Streptavidin-HRP

2 vials sCD134 Standard, lyophilized, 10 ng/ml upon reconstitution

1 bottle (50 ml) Wash Buffer Concentrate 20x (PBS with 1% Tween 20)

1 vial (5ml) Assay Buffer Concentrate 20x (PBS with 1% Tween 20 and 10 % BSA)

1 bottle (12ml) Sample Diluent

1 vial (7 ml) Substrate Solution I (tetramethyl-benzidine)

1 vial (7 ml) Substrate Solution II (0.02 % buffered hydrogen peroxide)

1 vial (12 ml) Stop Solution (1M Phosphoric acid)

1 vial (0.4 ml each) Blue-Dye, Green-Dye, Red-Dye

4 adhesive Plate Covers

Reagent Labels
5. STORAGE INSTRUCTIONS

Store kit reagents between 2° and 8°C. Immediately after use remaining reagents should be returned to cold storage (2° to 8°C). Expiry of the kit and reagents is stated on labels. The expiry of the kit components can only be guaranteed if the components are stored properly, and if, in case of repeated use of one component, the reagent is not contaminated by the first handling.

6. SPECIMEN COLLECTION

Cell culture supernatants, human serum, plasma or other biological samples will be suitable for use in the assay. Remove serum from the clot or red cells, respectively, as soon as possible after clotting and separation.

Samples containing a visible precipitate must be clarified prior to use in the assay. Do not use grossly hemolyzed or lipemic specimens.

Clinical samples should be kept at 2° to 8°C and separated rapidly before storing at -20°C to avoid loss of bioactive sCD134. If samples are to be run within 24 hours, they may be stored at 2° to 8°C. Avoid repeated freeze-thaw cycles.

For stability and suitability of samples refer to respective chapter.
7. MATERIALS REQUIRED BUT NOT PROVIDED

- 5 ml and 10 ml graduated pipettes
- 10µl to 1,000µl adjustable single channel micropipettes with disposable tips
- 50µl to 300µl adjustable multichannel micropipette with disposable tips
- Multichannel micropipette reservoir
- Beakers, flasks, cylinders necessary for preparation of reagents
- Device for delivery of wash solution (multichannel wash bottle or automatic wash system)
- Microwell strip reader capable of reading at 450 nm (620 nm as optional reference wave length)
- Glass-distilled or deionized water
- Statistical calculator with program to perform linear regression analysis.
8. PRECAUTIONS FOR USE

- All chemicals should be considered as potentially hazardous. We therefore recommend that this product is handled only by those persons who have been trained in laboratory techniques and that it is used in accordance with the principles of good laboratory practice. Wear suitable protective clothing such as laboratory overalls, safety glasses and gloves. Care should be taken to avoid contact with skin or eyes. In the case of contact with skin or eyes wash immediately with water. See material safety data sheet(s) and/or safety statements(s) for specific advice.

- Reagents are intended for research use only and are not for use in diagnostic or therapeutic procedures.

- Do not mix or substitute reagents with those from other lots or other sources.

- Do not use kit reagents beyond expiration date on label.

- Do not expose kit reagents to strong light during storage or incubation.

- Do not pipette by mouth.

- Do not eat or smoke in areas where kit reagents or samples are handled.

- Avoid contact of skin or mucous membranes with kit reagents or specimens.

- Rubber or disposable latex gloves should be worn while handling kit reagents or specimens.

- Avoid contact of substrate solutions with oxidizing agents and metal.

- Avoid splashing or generation of aerosols.
- In order to avoid microbial contamination or cross-contamination of reagents or specimens which may invalidate the test use disposable pipette tips and/or pipettes.

- Use clean, dedicated reagent trays for dispensing the conjugate and substrate reagents.

- Exposure to acids will inactivate the conjugate.

- Glass-distilled water or deionized water must be used for reagent preparation.

- Substrate solutions must be at room temperature prior to use.

- Decontaminate and dispose specimens and all potentially contaminated materials as if they could contain infectious agents. The preferred method of decontamination is autoclaving for a minimum of 1 hour at 121.5°C.

- Liquid wastes not containing acid and neutralized waste may be mixed with sodium hypochlorite in volumes such that the final mixture contains 1.0 % sodium hypochlorite. Allow 30 minutes for effective decontamination. Liquid waste containing acid must be neutralized prior to the addition of sodium hypochlorite.
9. PREPARATION OF REAGENTS

A. Wash Buffer

If crystals have formed in the Wash Buffer Concentrate, warm it gently until they have completely dissolved.

Pour entire contents (50 ml) of the Wash Buffer Concentrate into a clean 1,000 ml graduated cylinder. Bring final volume to 1,000 ml with glass-distilled or deionized water. Mix gently to avoid foaming. The pH of the final solution should adjust to 7.4.

Transfer to a clean wash bottle and store at 2° to 25°C. Please note that the Wash Buffer is stable for 30 days. Wash Buffer may be prepared as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Wash Buffer Concentrate (ml)</th>
<th>Distilled Water (ml)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 6</td>
<td>25</td>
<td>475</td>
</tr>
<tr>
<td>1 - 12</td>
<td>50</td>
<td>950</td>
</tr>
</tbody>
</table>

B. Assay Buffer

Mix the contents of the bottle well. Add contents of Assay Buffer Concentrate (5.0ml) to 95ml distilled or deionized water and mix gently to avoid foaming. Store at 2° to 8°C. Please note that the Assay Buffer is stable for 30 days. Assay Buffer may be prepared as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Assay Buffer Concentrate (ml)</th>
<th>Distilled Water (ml)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 6</td>
<td>2.5</td>
<td>47.5</td>
</tr>
<tr>
<td>1 - 12</td>
<td>5.0</td>
<td>95.0</td>
</tr>
</tbody>
</table>
C. Preparation of Biotin-Conjugate

Make a 1:100 dilution with Assay Buffer (reagent B) in a clean plastic tube as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Biotin-Conjugate (ml)</th>
<th>Assay Buffer (ml)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 6</td>
<td>0.03</td>
<td>2.97</td>
</tr>
<tr>
<td>1 - 12</td>
<td>0.06</td>
<td>5.94</td>
</tr>
</tbody>
</table>

D. Preparation of sCD134 Standard

Reconstitute sCD134 Standard by addition of distilled water. Reconstitution volume is stated on the label. Make sure the contents entirely dissolve by gentle swirling.

E. Preparation of Streptavidin-HRP

Make a 1:100 dilution of the concentrated Streptavidin-HRP solution as needed according to the following table:

<table>
<thead>
<tr>
<th>Number of Strips</th>
<th>Streptavidin- HRP (ml)</th>
<th>Assay Buffer (ml)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 6</td>
<td>0.060</td>
<td>5.94</td>
</tr>
<tr>
<td>1 - 12</td>
<td>0.120</td>
<td>11.88</td>
</tr>
</tbody>
</table>

F. TMB Substrate Solution

Using clean pipettes and containers known to be metal free, dispense an equal volume of Substrate Solution I into Substrate Solution II and swirl gently to mix. The TMB Substrate Solution may develop a yellow tinge over time. This does not seem to affect product performance. A blue colour present in the TMB Substrate Solution, however, indicates that it has been contaminated and must be discarded. The TMB Substrate Solution must be used within a few minutes after mixing. Warm to room temperature before use. Avoid direct exposure of TMB reagents to intense light and oxidizing agents during storage or incubation.
Substrate preparation according to assay size:

<tr>
<th>Number of Strips</th>
<th>Substrate Solution I (ml)</th>
<th>Substrate Solution II (ml)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - 6</td>
<td>3.0</td>
<td>3.0</td>
</tr>
<tr>
<td>1 - 12</td>
<td>6.0</td>
<td>6.0</td>
</tr>
</tbody>
</table>

G. Addition of colour-giving reagents: Blue-Dye, Green-Dye, Red-Dye

In order to help our customers to avoid any mistakes in pipetting the IBL-International ELISAs, IBL-International now offers a new tool that helps to monitor the addition of even very small volumes of a solution to the reaction well by giving distinctive colours to each step of the ELISA procedure.

This procedure is optional, does not in any way interfere with the test results, and is designed to help the customer with the performance of the test, but can also be omitted, just following the instruction booklet.

Alternatively, the dye solutions from the stocks provided (Blue-Dye, Green-Dye, Red-Dye) can be added to the reagents according to the following guidelines:

1. Diluent: Before sample dilution add the Blue-Dye at a dilution of 1:250 (see table below) to the appropriate diluent (1x) according to the test protocol. After addition of Blue-Dye, proceed according to the instruction booklet.

<table>
<thead>
<tr>
<th>5 ml Diluent</th>
<th>20 µl Blue-Dye</th>
</tr>
</thead>
<tbody>
<tr>
<td>12 ml Diluent</td>
<td>48 µl Blue-Dye</td>
</tr>
</tbody>
</table>
2. Biotin-Conjugate: Before dilution of the concentrated conjugate, add the **Green-Dye** at a dilution of 1:100 (see table below) to the Assay Buffer used for the final conjugate dilution. Proceed after addition of **Green-Dye** according to the instruction booklet, preparation of Biotin-conjugate.

<table>
<thead>
<tr>
<th>Assay Buffer</th>
<th>Green-Dye</th>
</tr>
</thead>
<tbody>
<tr>
<td>3 ml</td>
<td>30 µl</td>
</tr>
<tr>
<td>6 ml</td>
<td>60 µl</td>
</tr>
<tr>
<td>12 ml</td>
<td>120 µl</td>
</tr>
</tbody>
</table>

3. Streptavidin-HRP: Before dilution of the concentrated Streptavidin-HRP; add the **Red-Dye** at a dilution of 1:250 (see table below) to the Assay Buffer used for the final Streptavidin-HRP dilution. Proceed after addition of **Red-Dye** according to the instruction booklet, preparation of Streptavidin-HRP.

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>6 ml</td>
<td>24 µl</td>
</tr>
<tr>
<td>12 ml</td>
<td>48 µl</td>
</tr>
</tbody>
</table>
10. TEST PROTOCOL

a. Mix all reagents thoroughly without foaming before use.

b. Determine the number of Microwell Strips required to test the desired number of samples plus appropriate number of wells needed for running blanks and standards. Each sample, standard, blank and optional control sample should be assayed in duplicate. Remove extra Microwell Strips coated with Monoclonal Antibody to human sCD134 from holder and store in foil bag with the desiccant provided at 2°-8°C sealed tightly.

c. Wash the microwell strips twice with approximately 300 µl Wash Buffer per well with thorough aspiration of microwell contents between washes. Take care not to scratch the surface of the microwells.

After the last wash, empty wells and tap microwell strips on absorbent pad or paper towel to remove excess Wash Buffer. Use the microwell strips immediately after washing or place upside down on a wet absorbent paper for not longer than 15 minutes. Do not allow wells to dry.

d. Add 100 µl of Sample Diluent in duplicate to all standard wells. Prepare standard dilutions by pipetting 100 µl of reconstituted (refer to preparation of reagents, 9.D.) sCD134 Standard, in duplicate, into wells A1 and A2. Mix the contents of wells A1 and A2 by repeated aspiration and ejection, and transfer 100µl to well B1 and B2, respectively. Take care not to scratch the inner surface of the microwells. Continue this procedure five times, creating two rows of sCD134 standard dilutions ranging from 5000 to 78 pg/ml. Discard 100 µl of the contents from the last microwells (G1, G2) used.

</table>
e. Add 100 µl of **Sample Diluent** in duplicate to the blank wells.

f. Add 75µl of **Sample Diluent**, in duplicate, to the sample wells.

g. Add 25µl of each **Sample**, in duplicate, to the designated wells.

h. Prepare **Biotin-Conjugate** (refer to preparation of reagents).

i. Add 50 µl of diluted **Biotin-Conjugate** to all wells, including the blank wells.

j. Cover with a **Plate Cover** and incubate at room temperature (18° to 25°C) for 2 hours, if available on a microplate shaker set at 100 rpm.

k. Remove Plate Cover and empty wells. Wash microwell strips 3 times according to point c. of the test protocol. Proceed immediately to the next step.

l. Prepare **Streptavidin-HRP** (refer to preparation of reagents).

m. Add 100 µl of diluted **Streptavidin-HRP** to all wells, including the blank wells.

n. Cover with a **Plate Cover** and incubate at room temperature (18° to 25°C) for 1 hour, if available on a microplate shaker set at 100 rpm.

o. Prepare **TMB Substrate Solution** a few minutes prior to use (refer to preparation of reagents).

p. Remove Plate Cover and empty wells. Wash microwell strips 3 times according to point c. of the test protocol. Proceed immediately to the next step.

q. Pipette 100 µl of mixed **TMB Substrate Solution** to all wells, including the blank wells.
r. Incubate the microwell strips at room temperature (18°C to 25°C) for about 10 minutes, if available on a rotator set at 100 rpm. Avoid direct exposure to intense light.

The colour development on the plate should be monitored and the substrate reaction stopped (see point s. of this protocol) before positive wells are no longer properly recordable.

It is recommended to add the stop solution when the highest standard has developed a dark blue colour. Alternatively the colour development can be monitored by the ELISA reader at 620 nm. The substrate reaction should be stopped as soon as an OD of 0.6 – 0.65 is reached.

s. Stop the enzyme reaction by quickly pipetting 100 µl of **Stop Solution** into each well, including the blank wells. It is important that the Stop Solution is spread quickly and uniformly throughout the microwells to completely inactivate the enzyme. Results must be read immediately after the Stop Solution is added or within one hour if the microwell strips are stored at 2 - 8°C in the dark.

t. Read absorbance of each microwell on a spectro-photometer using 450 nm as the primary wave length (optionally 620 nm as the reference wave length; 610 nm to 650 nm is acceptable). Blank the plate reader according to the manufacturer's instructions by using the blank wells. Determine the absorbance of both, the samples and the sCD134 standards.

**Note:** In case of incubation without shaking the obtained O.D. values may be lower than indicated below. Nevertheless the results are still valid.
11. CALCULATION OF RESULTS

- Calculate the average absorbance values for each set of duplicate standards and samples. Duplicates should be within 20 per cent of the mean.

- Create a standard curve by plotting the mean absorbance for each standard concentration on the ordinate against the sCD134 concentration on the abscissa. Draw a best fit curve through the points of the graph.

- To determine the concentration of circulating sCD134 for each sample, first find the mean absorbance value on the ordinate and extend a horizontal line to the standard curve. At the point of intersection, extend a vertical line to the abscissa and read the corresponding sCD134 concentration.

For samples which have been diluted according to the instructions given in this manual 1:4, the concentration read from the standard curve must be multiplied by the dilution factor (x4).

Note: Calculation of samples with an O.D. exceeding 2.0 may result in incorrect, low sCD134 levels. Such samples should be re-analyzed at higher dilution rate in order to precisely quantitate the actual sCD134 level.

It is suggested that each testing facility establishes a control sample of known sCD134 concentration and runs this additional control with each assay. If the values obtained are not within the expected range of this control, the assay results may be invalid.

- A representative standard curve is shown in Figure 3. This curve cannot be used to derive test results. Every laboratory must prepare a standard curve for each group of microwell strips assayed.
Figure 3. Representative standard curve for sCD134 ELISA. sCD134 was diluted in serial two-fold steps in Sample Diluent, symbols represent the mean of three parallel titrations. Do not use this standard curve to derive test results. A standard curve must be run for each group of microwell strips assayed.

12. LIMITATIONS

- Since exact conditions may vary from assay to assay, a standard curve must be established for every run.

- Bacterial or fungal contamination of either samples or reagents or cross-contamination between reagents may cause erroneous results.

- Disposable pipette tips, flasks or glassware are preferred, reusable glassware must be washed and thoroughly rinsed of all detergents before use.

- Improper or insufficient washing at any stage of the procedure will result in either false positive or false negative results. Completely empty wells before dispensing fresh Wash Buffer, fill with Wash Buffer as indicated for each wash cycle and do not allow wells to sit uncovered or dry for extended periods.
13. PERFORMANCE CHARACTERISTICS

A. Sensitivity

The limit of detection of sCD134 defined as the analyte concentration resulting in an absorption significantly higher than that of the dilution medium (mean plus two standard deviations) was determined to be less than 1.8 pg/ml (mean of 6 independent assays).

B. Reproducibility

a. Intra-assay

Reproducibility within the assay was evaluated in three independent experiments. Each assay was carried out with 6 replicates of 8 serum samples containing different concentrations of sCD134. Two standard curves were run on each plate. Data below show the mean sCD134 concentration and the coefficient of variation for each sample. The overall intra-assay coefficient of variation has been calculated to be 8.0%.

C. Spike Recovery

The spike recovery was evaluated by spiking four levels of sCD134 into 4 different pooled normal human sera. The amount of endogenous sCD134 in unspiked serum was subtracted from the spike values. Mean recovery was 88%.

D. Dilution Parallelism

Four serum samples with different levels of sCD134 were assayed at four serial two-fold dilutions with 4 replicates each. In the table below the per cent recovery of expected values is listed. Recoveries ranged from 87% to 125% with an overall mean recovery of 109%.

E. Sample Stability

a. Freeze-Thaw Stability

Aliquots of serum samples (unspiked or spiked) were stored frozen at -20 °C and thawed up to 5 times, and sCD134 levels determined. There was no significant loss of sCD134 by freezing and thawing up to 5 cycles of freezing and thawing.

b. Storage Stability

Aliquots of a serum (spiked or unspiked) were stored at -20 °C, 2-8 °C, room temperature (RT) and 37 °C and the sCD134 level determined after 24 h. There was no significant loss of sCD134 immunoreactivity.

F. Specificity

The interference of circulating factors of the immune systems was evaluated by spiking these proteins at physiologically relevant concentrations into a sCD134 positive serum. There was no detectable cross reactivity.

G. Expected Serum Values

There are no detectable sCD134 levels found in healthy blood donors.

17. TEST PROTOCOL SUMMARY

- Wash microwell strips twice with Wash Buffer
- Add 100 µl Sample Diluent, in duplicate, to all standard wells
- Pipette 100µl reconstituted sCD134 Standard into the first wells and create standard dilutions ranging from 5000 to 78 pg/ml by transferring 100µl from well to well. Discard 100µl from the last wells
- Add 100µl Sample Diluent, in duplicate, to the blank wells
- Add 75µl Sample Diluent to the sample wells
- Add 25µl Sample, in duplicate, to designated wells
- Prepare Biotin-Conjugate
- Add 50 µl of diluted Biotin-Conjugate to all wells
- Cover microwell strips and incubate 2 hours at room temperature (18° to 25°C) on microplate shaker
- Prepare Streptavidin-HRP
- Empty and wash microwell strips 3 times with Wash Buffer
- Add 100µl of diluted Streptavidin-HRP to all wells
- Cover microwell strips and incubate 1 hour at room temperature (18° to 25°C) on a microplate shaker
- Prepare TMB Substrate Solution few minutes prior to use
- Empty and wash microwell strips 3 times with Wash Buffer
- Add 100 µl of mixed TMB Substrate Solution to all wells including blank wells
- Incubate the microwell strips for 10-20 minutes at room temperature (18° to 25°C) on a microplate shaker
- Add 100 µl Stop Solution to all wells including blank wells
- Blank microwell reader and measure colour intensity at 450 nm

Note: Calculation of samples with an O.D. exceeding 2.0 may result in incorrect, low sCD134 levels. Such samples require further dilution with Sample Diluent in order to precisely quantitate the actual sCD134 level.
LIABILITY: Complaints will be accepted in each mode – written or vocal. Preferred is that the complaint is accompanied with the test performance and results. Any modification of the test procedure or exchange or mixing of components of different lots could negatively affect the results. These cases invalidate any claim for replacement. Regardless, in the event of any claim, the manufacturer’s liability is not to exceed the value of the test kit. Any damage caused to the kit during transportation is not subject to the liability of the manufacturer.
